Trends in Gram-negative bloodstream infection, antimicrobial use and antimicrobial resistance in Northern Ireland

Trends in Gram-negative bloodstream infection, antimicrobial use and antimicrobial resistance in Northern Ireland

Introduction:
Antimicrobial resistance (AMR) is a present and growing threat to global human health. Gram-negative organisms present a particular challenge due to their ability to develop resistance, while the inappropriate and overuse of antibiotics further accelerates the AMR process. The Northern Ireland (NI) Department of Health, Social Services and Public Safety aimed to ‘establish and maintain systems to monitor antimicrobial usage and surveillance of resistance’ (DHSSPSNI, 2012). The selected results outlined in this poster are the product of that system. Full results are available at: http://pha.site/AMR2017

Methods:
Antibiotic susceptibility testing. Reported to PHA as:
• Susceptible (S): growth inhibited in vitro by a concentration of the drug associated with a high likelihood of therapeutic success.
• Indeterminate (I): concentration required to inhibit growth in vitro associated with uncertain therapeutic outcome at standard doses.
• Resistant (R): concentration required to inhibit growth in vitro associated with a high likelihood of therapeutic failure.

*I and R grouped together as ‘Non-Susceptible’ for reporting purposes.

Results:

**E. coli**
Bloodstream Infection
980 in 2009
1487 in 2016

**K. pneumonae**
Bloodstream Infection
143 in 2009
208 in 2016

**Pseudomonas Spp.**

Resistance:
• Susceptible (S): growth inhibited in vitro by a concentration of the drug associated with a high likelihood of therapeutic success.
• Indeterminate (I): concentration required to inhibit growth in vitro associated with uncertain therapeutic outcome at standard doses.
• Resistant (R): concentration required to inhibit growth in vitro associated with a high likelihood of therapeutic failure.

*I and R grouped together as ‘Non-Susceptible’ for reporting purposes.

Conclusions:
• There has been an increasing incidence of gram-negative bloodstream infections and a small rise in the proportion resistant to selected antibiotics.
• Rates of antibiotic consumption are stable but substantially higher than other parts of the UK.
• We have limited information about who is receiving antibiotics and who is prescribing them.

Recommendations:
• Further investigation is needed to identify who is receiving and prescribing antibiotics in Northern Ireland.
• Availability of timely, detailed intelligence for practitioners/managers should help target efforts to reduce consumption and inappropriate antibiotic use.
