INTERSECTIONALITY AND THE NOTION OF DISABILITY IN EU DISCRIMINATION LAW

DAGMAR SCHIEK*

Abstract

Defining the characteristics targeted by banning discrimination constitutes a central challenge for EU discrimination law, and defining disability is particularly challenging due to the dispute around the very concept of disability. From 2006, the ECJ has wrestled with this definition in six judgments, five of which were delivered as of 2013. Instead of classifying the case law definition as conforming to a medical or social model of disability, this article analyses the case law with a view to illustrate challenges of defining discrimination grounds generally, suggesting that a sufficiently precise and non-exclusive definition of discrimination grounds can be achieved by re-focusing EU discrimination law around the nodes of sex, race and disability. The analysis exposes that the ECJ definition of disability neither complies with the UN CRPD nor adequately responds to intersectionality theory, for example because the definition is exclusionary in relation to female experience of disability.

1. Introduction

Fifteen years after the EU first legislated against discrimination on grounds of disability,1 ECJ case law on the notion of disability has gained some momentum: moving on from a single case on distinguishing disability from long-term illness in 2006,2 the Court has delivered no less than six rulings on the definition of the term disability in EU discrimination law, culminating in the Kaltoft ruling of December 2014,3 which indicated that dismissal on the

* Professor of Law, Jean Monnet ad personam Chair in EU Law & Policy, Director of Centre for European and Transnational Legal Studies, Queen’s University Belfast. Thanks are due to Theresia Degener and Anna Lawson for sharing their partly unpublished work, and to the anonymous referees whose valuable critique spurred me to clarify and enhance my argument. The usual disclaimer applies.

grounds of extreme obesity might constitute disability discrimination within this framework.

Disability law experts have already commented on these rulings from the perspective of EU disability law and policy, focusing on the question whether the Court goes beyond a medical model of disability and embraces the social model of disability, making reference to the UN Convention on the Rights of Persons with Disabilities (CRPD).

However, this series of cases deserves a more fundamental analysis due to the central relevance of the categories on the basis of which discrimination is outlawed (discrimination grounds) for the wider field of EU discrimination law. Their definition not only demarcates the boundaries of discrimination law, but also harbours the danger of compartmentalizing the field into discrete sections, such as sex discrimination law, race discrimination law and disability discrimination law. Such compartmentalization weakens discrimination law, for example by refusing to award remedies to those at the intersections of discrimination grounds – one of the points made by socio-legal researchers who developed intersectionality theory. This article argues that intersectionality theory can and should also inform the central categories of

5. Kimberlee Crenshaw coined the term intersectionality in the 1980s when critiquing the neglect of black women’s discrimination by US anti-discrimination law (Crenshaw, “Demarginalizing the intersection of race and sex: A black feminist critique of antidiscrimination doctrine, feminist theory and antiracist politics”, (1989) University of Chicago Legal Forum, 107–167). Intersectionality theory has recently been re-phrased as a socio-legal research agenda by a group of authors including Crenshaw (Cho, Crenshaw and McCullogh, “Towards a field of intersectionality studies: Theory, applications and praxis”, 38 Signs: Journal of Women in Culture and Society (2013), 785–810). European intersectionality studies initially concentrated in sociology and political science (e.g. Anthias and Yuval-Davis, “Contextualizing feminism: Ethnic, gender and class divisions”, 15 Feminist Review (1983), 62–75; Krzszán, Skeje and Squire, Institutionalizing Intersectionality: The Changing Nature of European Equality Regimes (Macmillan, 2012) and only recently involve legal scholars (see e.g. Grabham, Cooper et al. (Eds.), Intersectionality and Beyond: Law, Power and the Politics of Location (Routledge, 2009); Schiek and Lawson (Eds.), EU Non-Discrimination Law and Intersectionality: Investigating the Triangle of Racial, Gender and Disability Discrimination (Ashgate, 2011), specifically on remedies as added value of intersectionality see Schiek, “Multiple discrimination in EU law: Opportunities for legal responses to intersectional gender discrimination? (executive report)”, in Burri and Schiek (Eds.), Multiple Discrimination in
discrimination law: it demands that courts, in defining discrimination grounds, avoid exclusion across grounds, for example by failing to recognize the disabling effect of impairments typically suffered by women or ethnic minorities. The question how discrimination grounds should be defined in order to avoid such seemingly discriminatory effects of the definition has as such not yet been the subject of academic debate. Suggestions can be derived from the reconceptualization of discrimination law through organizing its categories around the interconnected nodes of sex/gender, race/ethnicity and disability, which mirror disadvantage resulting from ascribed otherness.\(^6\) Disability discrimination law is an ideal field for exploring this further, and the exploration can also contribute to a more adequate legal definition of disability.

In order to develop this argument, the next section will outline the relevance of EU disability discrimination law for defining the categories of EU discrimination law as a whole, and specify which aspects of the wider field of disability law and policy are relevant to the discussion. This will be followed by a summary of the Court’s first and last judgments on the notion of disability,\(^7\) which the Court’s advocates general classify as progressively adopting a social model of disability. The fourth section develops the theoretical frame for the case law analysis: it maps the debate around the medical and social model of disability as sociological concepts, locates its impact on the CRPD; and specifies the relevance of intersectionality theory for a suitable definition of disability and other discrimination grounds by reference to the nodes model mentioned before. The fifth section critically analyses the six judgments, exposing that the Court does not use either the social model or the CRPD’s guidelines for defining disability. The analysis will also expose that neither model of disability is suitable for a legal definition of a discrimination ground, especially as both tend to exclude disproportionately disabilities afflicted upon those who are not white middle class men. The last point is illustrated with examples from the intersection of gender and disability. The article concludes that much remains to be done so as to develop an adequate definition of disability for EU discrimination law.

\(^{7}\) Cases C-13/05, Chacón Navas and C-354/13, FIO Kaltoft.
2. The relevance of disability law for the field of discrimination law

As a prism gathers sunlight and reflects it in multiple colours, disability discrimination law underlines the multiple challenges to be met in defining the characteristics on the grounds for which discrimination is targeted by law (discrimination grounds), which are again central to its mission.

Since EU discrimination law emerged from socio-political movements, initially focused on discrete experiences, its application tends to insulate the experience of discrimination into discrete strands such as sex discrimination law, race/ethnicity discrimination law and disability discrimination law. The resulting compartmentalization is criticized because it does not adequately capture discrimination at the intersection of discrete grounds. Beyond this, compartmentalization also reduces the impact of discrimination law: as a multifaceted field it is potentially more powerful than the sum of each of its components. However, the injustices addressed by discrimination law may seem very discrete and diverse: racist hate crime and the refusal to promote women to managerial posts may not seem connected at first sight. While the EU, in combining a competence for outlawing discrimination on grounds of sex, race, ethnic origin, age, disability, sexual orientation and religion and belief in one provision (Art. 19 TFEU) has conceptualized EU discrimination law as one socio-legal field, protagonists do not readily acknowledge an overarching rationale unifying the discrete experiences. As a result, the practical application of EU discrimination law still fails in addressing intersectional discrimination.

Disability discrimination law constitutes a microcosm of this same problem, due to the wide variety of conditions which may lead to recognizing a disability. Those conditions range from those easily perceptible in everyday contact – such as missing limbs, facial deformation or sensual deviations such as visual or hearing impairments – to other conditions which are not easily discernible, including illnesses such as heart disease, diabetes, clinical depression or chronic fatigue syndrome. Such diversity seems ill-suited for instigating spontaneous solidarity across different disabilities. Nevertheless,

defining disability as a discrimination ground has the potential of combining these disparate experiences into a socio-legal field of its own. The disability rights movement at national and European levels seems to have achieved just that, by establishing a common cause for those very diverse experiences by shifting focus. Traditionally, disability had been perceived as a deficit of the person, which possibly can be cured, and as long as it is not cured requires compensation. The focus on the individual person who deviated from normalcy implied countless specific responses, frequently associated with paternalism and de-recognition. By contrast, the disability rights movement focused on the reaction of society to the (alleged) deviance from normalcy, partly going as far as viewing disability as merely a “social construct”. Unifying all the different individuals under a social construct notion of disability also defined an overarching aim for the ban of disability discrimination, claiming a common cause for overcoming disadvantage based on a wide variety of conditions. Such success surely holds lessons for discrimination law at large.

Accordingly, this article is not dedicated to EU disability law and policy as a whole, which overlaps with, but is both wider and narrower than EU discrimination law and policy. On a pragmatic definition, EU discrimination law comprises a body of secondary EU law aiming at securing equal treatment irrespective of sex, racial or ethnic origin, religion and belief, disability, age, and sexual orientation. While these directives are predominantly based on

what is today Article 19 TFEU, primary law provides normative underpinnings in Articles 8, 10 and 157 TFEU and Articles 21–26 Charter of Fundamental Rights (hereafter: CFREU).

The EU discrimination directives are quite explicit (and as such limiting) on the notion of discrimination: they demand that Member States enact legislation banning discrimination on all the six “discrimination grounds” in the fields of employment. Race and sex discrimination also need to be addressed beyond employment to various degrees, for example in relation to social security, education, health, and access to and provision with goods and services. Banning discrimination requires providing effective remedies beyond criminal prosecution against direct discrimination, indirect discrimination, harassment and instruction to discriminate. Only for disability discrimination, the refusal to provide reasonable accommodation of difference also constitutes discrimination.

However, the directives are silent (and thus less limiting) on another central element of the field: the definition of the characteristics for which discrimination is targeted by law (discrimination grounds) is specified neither at EU level nor in most national laws. Since this field is left to judicial interpretation, the first six judgments of the European Court of Justice on disability hold lessons for the definition of discrimination grounds at large, as supply of goods and services, O.J. 2004, L 373/37; as well as Directive 2006/54/EC of the Parliament and the Council on the implementation of the principle of equal opportunities and equal treatment of men and women in matters of employment and occupation (recast) O.J. 2006, L 204/23, 2006/54 and Council Directive 79/7/EEC on the progressive implementation of the principle of equal treatment for men and women in matters of social security O.J. 1979, L 6/24. While at times a narrower notion of EU discrimination law is used, comprising Directives 2000/43 and 2000/78 only, because those directives marked a new era (e.g. Bell, “The principle of equal treatment: Widening and deepening”, in Craig and De Bürca (Eds.), The Evolution of EU Law (OUP, 2011), p. 623), most academic writers perceive EU anti-discrimination law as encompassing sex discrimination (see for more references Schiek, op. cit. supra note 8 at pp. 472–481).

16. The directives targeting sex discrimination in employment are based on what is today Art. 153 TFEU. The reasons for this split in competence deserve their own critique, which lies beyond the scope of this article.

18. The exclusion of discrimination grounds such as sex, age, and religion, from this concept has been criticized, alongside the limited potential of reasonable accommodation to promote structural change (Schiek, “Broadening the scope and the norms of EU gender equality law: Towards a multidimensional conception of equality law”, 12 MJ (2005), 463–464).

19. The two common law jurisdictions, and notably UK law, have partly been an exception to this rule, see Quinn and Flynn, op. cit. supra note 13, 40–41.
well as the opportunity to establish new directions for the interrelation of intersectionality and law.

3. The Court’s route from Chacón Navas to Kaltoft – A first impression

The Court’s first and the last rulings on the notion of disability illustrate well the development of the case law under analysis: the latest case FOA (Kaltoft), 20 concerning obesity, partly confirms the very first one, Chacón Navas,21 concerning long-term illness. Although this may indicate that the Court moves in circles, its advocates general present these cases as start and end-point of a move towards accepting a social model of disability.

The Chacón Navas case dates back to 2006, and concerned the dismissal of a female employee by a catering provider on grounds of long periods of absence on grounds of illness. While this dismissal was unlawful under Spanish labour law, the only remedy available was a compensation. Had the dismissal been discriminatory, the remedy would have been reinstatement. This inspired the Madrid labour court to refer the case to the Court of Justice, with two main questions. First the national court enquired whether EU law must be interpreted as including a ban on discrimination on grounds of long term illness, and in the second instance it wished to know whether the notion of disability in Directive 2000/78/EC encompasses long term illness.

The Court of Justice answered the first question in the negative on the rationale that today’s Article 19 TFEU does not, in itself, prohibit discrimination, but rather provides an EU competence to legislate against discrimination. This competence again is limited to banning discrimination on a finite number of grounds, and neither the competence nor the legislation based on it can be expanded by interpretation. 22

In its second question on the notion of disability, the referring court cited the World Health Organization’s International Classification of Functioning, Disability and Health (ICF), which stresses the fluid boundaries between health, sickness and disability. This indicated the national judges’ hope of achieving a broad notion of disability under EU law, which might encompass long-term illness in certain circumstances. The Court of Justice was not inspired to follow these suggestions. While it grasped the opportunity to claim the notion of disability under Directive 2000/78/EC as an autonomous

21. Case C-13/05, Chacon Navas.
concept under EU law, it also delivered a relatively narrow definition, stating that the “concept of ‘disability’ must be understood as referring to a limitation which results in particular from physical, mental or psychological impairments and which hinders the participation of the person concerned in professional life”.24

From this narrow notion of disability the Court concluded that disability must be distinguished from sickness, in particular through its long duration.26 This chimed with Advocate General Geelhoed’s concern that a finding of disability discrimination will “always entail a substantive claim to equal access to or continued employment” with “potentially far-reaching consequences, economic and financial”,27 which in his view warranted a “precise definition” of disability, while the principal competence of the Member States for social policy mitigated against “widening the scope of Article 13 EC [now: Art. 19 TFEU] by relying on the general policy of equality”.28 While the Advocate General acknowledged that disability was an “indeterminate concept”,29 “undergoing a fairly rapid evolution”,30 he proposed the narrow definition accepted by the Court.31

The FOA Kaltoft ruling related to the dismissal of a childminder employed by a Danish municipality, who had been classed as obese in line with the WHO ICD from 1998. After his return from a period of family-related leave in March 2010, Mr Kaltoft’s limited success in losing weight through employer-supported fitness training was discussed in several unannounced meetings with the organization’s director. When demand for municipal child-care decreased, Mr Kaltoft was selected for dismissal. His obesity had been mentioned in the relevant consultation meeting, though the employer contested that the dismissal was based on obesity.

The national court mainly wished to explore whether EU law, due to Articles 21–26 CFREU now being legally binding, contains a general prohibition of obesity discrimination or a general ban of discrimination in employment. The question whether obesity can be classified as disability under Directive 2000/78 was only their secondary concern. The Court referred to and confirmed the principles developed in Chacón Navas: the list

of grounds on which discrimination is banned by Directive 2000/78/EC cannot be expanded by way of interpretation, and there is no general ban on weight discrimination to be derived from the CFREU. The Court only made very scant reference to the CFREU, omitting to mention any specific Article. Advocate General Jääskinnen’s Opinion explains this omission. While the list of discrimination grounds in Article 21 CFREU is open-ended, and might thus include obesity, the CFREU must not expand the EU’s competences. The Advocate General thus returned to the concern raised by Advocate General Geelhoed in Chacón Navas: Member States’ prerogatives in social policy matters are to be safeguarded. The CFREU principles would only bind a Member State if its legislation falls within the substantive scope of EU legislation or directly effective Treaty law: a legislative competence such as Article 19 TFEU is not sufficient to achieve this. In so far, the case law has come full circle.

However, as regards the notion of disability, the Court quoted the definition of disability developed by its Grand Chamber earlier

“Following the ratification by the European Union of the United Nations Convention on the Rights of Persons with Disabilities, which was approved on behalf of the European Community by Council Decision 2010/48/EC of 26 November 2009 (O.J. 2010, L 23/35), the Court held the concept of ‘disability’ must be understood as referring to a limitation which results in particular from long-term physical, mental or psychological impairments which in interaction with various barriers may hinder the full and effective participation of the person concerned in professional life on an equal basis with other workers.”

The Court thus stressed that it now adheres to the notion of disability promoted by the CRPD, while Advocate General Jääskinen suggested that the Court had moved towards the social model of disability. It is open to doubt, however, whether the argumentation of the Court and its advocates general in the younger case law on disability complies with the social model of

34. The Court cited para 56 of the Chacón Navas ruling, as well as para 46 of Coleman, which is mainly relevant for acknowledging discrimination by association (Case C-303/06, S. Coleman v. Atridge Law and Steve Law, EU:C:2008:415).

disability.\textsuperscript{40} In addition, the point can be made that the dichotomy between a medical and a social model of disability is not a sufficient starting point to develop the notion of disability for the purposes of EU discrimination law, especially if addressing intersectional inequalities.

Before we can analyse the case law in detail in the light of these considerations, it is necessary to summarize the discussion on the notion of disability initiated by the disability rights movement and its relation to the CRPD, as well as developing a theoretical frame for legal definitions of discrimination grounds in the light of intersectionality theory.

\section*{4. Notions of disability and intersectional inequality: Theoretical frame}

\subsection*{4.1. Medical and social models of disability and the UN CRPD}

As already indicated, the terms “medical” and “social model of disability” have been developed in the disability rights movement. The underlying socio-political discourse perceives the move from the medical to the social model of disability as progressive, which seems to indicate that there is no space for the medical model in applying EU discrimination law.

The medical model appears as a “parody”\textsuperscript{41} at times: by defining disability mainly with reference to an impairment attached to a person, the medical model allegedly suggests that such limitations for persons with disabilities can and should be overcome by medical cures or treatment and, if this fails, by physical or technological processes addressing the impairment. Such processes aim at reinstating a state of normalcy, idealizing a world in which human beings do not differ too much: disability is defined as deviation from the average state of health.\textsuperscript{42}

Those categorizations originate not from discrimination law, but rather from specific legislation creating entitlements for disabled persons, for example special benefits replacing or supplementing income from employment, or claims to specific services allowing participation.\textsuperscript{43} This purpose corresponds to a metric approach to defining disability, since different degrees of disability lead to different levels of entitlement. These

\footnotesize{42. Geist, Petermann and Widhammer, “Disability law in Germany”, 24 Comparative Labor Law & Policy Journal (2003), 563 et seq.}
\footnotesize{43. See Degener, op. cit. supra note 12, No. 2 and 6; see also Mabbet, “Some are more equal than others: Definitions of disability in social policy and discrimination law in Europe”, 34 Journal of Social Policy (2002), 215–233.}
differentiations constitute contestable political choices: it would be entirely possible to grant assistance or benefits in relation to individual need without requiring a medical statement related to a degree of disability. The distinction between disability benefits and “normal” unemployment benefits, for example, can be traced back to more favourable treatment of war veterans who had impairments related, for example, to the loss of limbs, as compared with other unemployed persons. Modern welfare States have overcome the underlying causal approach to disability, according to which those who suffered impairment while engaged in a good cause are most deserving, followed by those suffering impairment without contributing (e.g. by being born with an impairment or involvement in an accident), and last by those who somehow contributed to their impairment. Nevertheless, the medicalization of deviance has remained decisive for classifying persons as disabled.

This classification is criticized as a social construct, based on interaction of law and medicine, and perceived as a starting point for discrimination and exclusion of those labelled as belonging to the category of disabled persons. The social model of disability was developed with the aim of politically challenging such discrimination and exclusion. Its proponents suggested that disability results from society’s reaction to impairments, and not the impairments as such. In its most radical form, the social model was originally developed by the British Union of Physically Impaired Against Segregation (UPIAS). Their refined policy statement established in 1975 relied on the slogan that “it is society which disables physically impaired people”. The core idea is the distinction between impairment and disability. Disability refers to the restriction of activity participation. It results from the lack of taking into account physical impairments, but not from the physical impairments as such. Parallels have been drawn to the feminist distinction between sex, which has a biological base, and gender, which is an ascription of roles to women.

Since the 1970s, the debates on sociological models of disability have been refined. In particular, the UPIAS definition has been criticized for neglecting

44. Ibid., 222–224.
the impact of impairment on the life-experience of disabled people, as well as for rejecting any positive role of medical cures or treatment for the life experience of people with impairments. Treating or curing impairments in line with a true medical mission, which is not driven by the paternalistic urge to normalize, can be beneficial to someone suffering from ill health. Any model of disability that neglects impairment will downplay the experience of chronic illness, especially if involving high levels of pain, or of conditions such as depression, arthritis, chronic fatigue syndrome (ME) or diabetes. These only fit the “barrier” model of disability with difficulty: prejudices aside, there is no single barrier (such as a staircase) the removal of which will alleviate suffering from those long-term conditions. Accommodating these conditions into models of disability requires acknowledging suffering, for which there is limited room in the social model of disability.

While the social model of disability has been critiqued, medical approaches to disability have also changed, as mirrored in the International Classification of Functioning, Disability and Health (ICF), approved by the 54th WHO assembly in 2001. The ICF aims at “measuring health and disability at both individual and population level”. It is thus firmly based on a metric notion of disability. However, it acknowledges that every human being may experience illness and disability throughout his or her life course. It is also claimed that “ICF takes into account the social aspects of disability and does not see disability only as a ‘medical’ or ‘biological’ dysfunction. By including Contextual Factors, in which environmental factors are listed ICF allows to records the impact of the environment on the person’s functioning”.

If disability is an aspect of life insofar as very few people command all abilities a human being can have, strategies in disability policy can focus on adapting the environment to a wider spectrum of abilities, and abandoning expectations of “normality”. The ubiquity of disability under this notion also potentially increases the attractiveness of disability as a subject of funded research: like age, disability is perceived as a condition that is likely to affect everyone in due course. Accordingly, one might expect a coalition of powerful white men to support research in, and juridical responses to

54. E.g., Alexander Somek’s scalding critique of EU anti-discrimination law, which ignores most of the literature on the subject, and only perceives disability discrimination law with its fluid categories and the concept of reasonable accommodation as worthy of being maintained (An Essay on EU Anti-Discrimination Law (OUP, 2013)).
disabilities, because disability of some kind is likely to be experienced by
themselves and their peers. If this is the case, care must be taken to not
prioritize the disabilities of some people rather than others through the way in
which disability is defined.

Overall, the path from the medical to the social model of disability is not a
clear route to progress. Degener even suggested that the social model does not,
in itself, “give any guidance as how to alternatively legally define disability” because it lacks a clear distinction between characteristic and treatment. Perju argued that this lack of precision leads judges to revert to the medically inspired categorizations.

A human or civil rights model has been promoted as moving beyond both the medical and the social model of disability. The UN Convention on the Rights of Persons with Disabilities (CRPD), as a legal instrument, constitutes an attempt to address such criticism. It refrains from blending out impairment, while acknowledging the social conditioning which, in interaction with impairment, creates disability, and demands a structural instead of an individual response. As a consequence of concerns about defining disability, the CRPD does not provide a comprehensive definition, leaving scope for future development. Its first article states: “Persons with disabilities include those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others.”

This open definition acknowledges the role of impairment as well as the relevance of socio-economic barriers hindering full participation. However, it does not fully incorporate the social model of disability, as suggested by the reference to “persons with disabilities” in its title. By contrast, adepts of the social model of disability prefer speaking of “disabled persons” instead of “persons with disabilities”. Since the UN Convention not only bans discrimination, but also provides for socio-economic rights for persons with

57. Ibid.

60. Quinn and Flynn, op. cit. supra note 13.
62. Ibid.
disability, the notion of disability may well differ in discrimination law inspired by the Convention on the one hand and laws creating entitlements to subsidies on the other. Article 2 defines disability discrimination as exclusion and deprivation related to disability – thus refraining from specifying a definition for the purposes of discrimination law. Relying on Article 1, the definition of disability in discrimination law may take impairment as a starting point. Its exact shape is left to implementing legislation – and as we have seen, EU legislation does not provide such a definition. All we can derive from the legal instruments which emanated from decades of debate on the notion of disability is that there is scope for taking impairment as a starting point, though disability in the sense of depriving persons from participation in society only emerges from the interaction of impairment with social factors.

4.2. Defining disability without reinforcing discrimination: Intersectionality and the definition of grounds

A definition of disability for the purposes of discrimination law must certainly not be discriminatory in itself. This leads to another dimension of critique of the social model.

The remaining advocates of a “pure” social model tend to highlight certain categories of disability, in particular the visible lack of a limb or part thereof, or certain sensual capacities, such as vision or speech. Such perspective has been criticized as being based on a limited ideal person, namely a virtuous individual, mainly a young male wheelchair user, who is otherwise “fit and never ill”, while the majority of wheelchair users are women over 60 suffering from long-term illness which does not totally exclude the use of stairs. Also, the majority of people affected by chronic illness with high levels of pain, or by conditions such as depression, arthritis, chronic fatigue of care that promotes human rights”, 16 Hypatia, (2011), 9; Kaper, Feminist, Queer, Crip (Indiana University Press, 2013).

65. This may be illustrated by publications by US disability activists who define the impairment that leads to disability as “lacking part or all of limb, organ or mechanism of the body”, Loewen and Pollard, “The social justice perspective”, 23 Journal of Postsecondary Education and Disability (2010), 10.

67. Crow, ibid.
syndrome (ME) or diabetes are women, indicating a gender bias of the social model of disability: it blends out real-life experiences of women more frequently than those of men. Acknowledging the role of impairment in defining disability may thus reduce sexist elements of the notion of disability. This indicates the relevance of intersectionality theory for the definition of disability.

Intersectionality as a term was initially coined by Kimberlee Crenshaw in order to challenge how US American discrimination law de-recognized disadvantage experienced specifically by black women. Following her own terms, Crenshaw aimed to create a meso-level theory which would inform action research. Her initial focus was on adequate remedies for discrimination at the intersection of grounds. Intersectionality theory has been taken up by sociologists and political scientists as an instrument in analysing categories of disadvantage in society. The resulting complex theory has been criticized as being of little relevance to law. Indeed, since law is a blunt sword, discrimination law depends on a finite number of categories in order not to be overly diluted. Clearly this poses dilemmas for defining discrimination grounds, in particular if discrimination law addresses socio-economic reality and not just State and other public action. As has become apparent from the short summary of the first and most recent ECJ cases on the notion of disability, defining discrimination grounds also specifies the scope of discrimination law and the intensity of its intervention. Thus, principles such as the rule of law instigate precision of this definition, as well as a focus on differences that make a difference.

The point made by the intersectionality discourse highlights two dilemmas in principle. First, while each of the discrimination grounds acknowledged as relevant in law is based on a specific social experience of disadvantage, each person is characterized by each of the discrimination grounds: either they suffer discrimination (for example because they are classified as disabled, as female or as “racialized other”), or they profit from discrimination (for example because they are classified as healthy, male or white). Second, discrimination law, in banning ground-specific discrimination may rest on different rationales, which may even clash: for example, the protection against

72. For more detail see Schiek, op. cit. supra note 6.
73. The following paragraph constitutes a very short summary of Schiek, “Towards a multidimensional conception”, op. cit. supra note 18, pp. 441–453.
ethnic and religious discrimination may rest on a rationale that pursues the preservation of closed communities engaging in practices that marginalize women or those choosing a lifestyle non-compliant with heteronormativity.

This creates a complex matrix in two respects. First, due to the asymmetric character of discrimination, persons may suffer from discrimination and at the same time profit from it. For example, a man with a mobility impairment may, due to being male (and perceived as such), be able to command free services of female relatives helping not only to accommodate this impairment but also by performing his housework. While that person may be protected by disability discrimination law, the person serving him unpaid or underpaid may need protection by sex discrimination law. Second, if rationales for protecting against discrimination on different grounds clash, equal protection against discrimination of all these grounds seems elusive. Instead, discrimination regimes frequently create a hierarchy of equalities, which again do not provide adequate protection for those on the intersection of grounds.

These dilemmas call for an integrated approach to discrimination law. Such an integrated approach presupposes a common rationale for the whole field of discrimination law, and all the discrimination grounds to be addressed by the field. Achieving this requires both an abstraction from ground-specific rationales and a refocusing of discrimination law around a finite number of dimensions.

The common rationale for banning discrimination on all grounds consists of overcoming disadvantage derived from ascribed otherness. Ascribing otherness is a social process through which persons are categorized by others. Such categorization through heteronomous acts challenges self-determination and autonomy.

Being excluded from full participation in economic, social or political life on the basis of a heteronomous ascription sums up the harm inflicted by discrimination. Since ascription is a heteronomous act, for the purposes of discrimination law it does not matter whether a person carries a certain characteristic. Accordingly, in order to show discrimination on grounds of sexual orientation, the affected person does not have to show that he is actually homosexual, as long as he is perceived as homosexual. Similarly, in order to show disability discrimination, it is sufficient that the affected person demonstrates that she is perceived as disabled. This makes any metric approach to disability not only unnecessary, but fundamentally wrong for the purposes of discrimination law.

In addressing the harm of discrimination by ascription, discrimination law must respond to two underlying rationales at the same time: enabling individuation and respecting difference.

74. Ibid., pp. 460–464.
Individuation demands that persons are allowed to move outside the box created by expectations based on ascribed otherness. Discrimination law in this dimension combats stereotyping, for example by ensuring that women can move beyond a restricted set of roles frequently circumscribed by the terms mother and sex-worker, that persons ascribed an inferior status on the basis of alleged race or ethnicity can act as fully accepted members of any community and that persons perceived as disabled must not be subjected to restricting expectations. Individuation, beyond stereotyping, frequently also entails the right to change one’s identity – to forswear a religion or an alleged race, or to undergo medical treatment in order to overcome an impairment if that is possible.

Respecting difference, on the one hand, demands protecting strands of identity a person does not wish to and should not be expected to give up. Further, respecting difference requires guaranteeing equality in practice in spite of durable differences. Examples for these include the ability to become pregnant, or the different abilities of those considered disabled, as well as decline through the process of ageing. Lack of opportunities to participate partly results from the normativity of certain abilities being ingrained in the design of buildings, communication and transport. However, the durable differences mentioned above are hard disparities: for example someone may not be able to see, or become slower in their reactions with age, or be more predisposed to suffer damage from alcohol consumption. Beyond the need to surpass formal notions of equality, discrimination grounds such as sex, disability and age require that the law accepts the need to accommodate difference. The CRPD accepts this by defining the refusal to accommodate difference as a form of discrimination.75

Refocusing discrimination law in such a way that potential intersections between grounds are recognized can be achieved by organizing EU discrimination law around the three nodes of sex/gender, race/ethnicity and disability/impairment.76 The concept proposes to re-organize EU discrimination law as a socio-legal field around these three nodes. The notion of the socio-legal field alludes to Bourdieu’s notion of a champ social77 comprising a social space established by social interaction on the basis of

75. Art. 2 CRPD; Degener, op. cit. supra note 12, marginal number 3.
76. Schiek, op. cit. supra note 6.
77. A short definition of the concept reads “A field is a structured social space, a field of forces, a force field. It contains people, who dominate and people who are dominated. Constant permanent relationships of inequality operate inside this space, which at the same time becomes a space in which various actors struggle for the transformation or the preservation of the field” (Bourdieu, On Television. Translated by Parkhurst Ferguson. (New Press, 1998), pp. 40–41).
power struggles.\textsuperscript{78} For the context of EU law, the socio-legal field needs to embrace interrelations between different levels of socio-economic governance as well as the shaping of interaction through authoritative legal texts.\textsuperscript{79} In short the field comprises legal texts, including case law, as well as institutional actors and socio-economic and cultural actors engaging in the field of discrimination law and policy.

The three nodes comprise centres and orbs, allowing the attribution of discrimination grounds such as sexual orientation and transsexuality to the gender/sex nodes; religious minority, language and culture to the race/ethnicity node; and age, pregnancy and long-term illness to the disability node.

The nodes concept also provides orientation for developing notions for individual discrimination grounds in ways that are feasible for adjudication and avoid the reinforcement of intersectional inequalities within individual categories. The disability node is related to the notion of bodily and mental autonomy and access to social interaction as well as other resources. Disability discrimination emerges from defining average abilities as a standard for normality, \textsuperscript{80} as well as from society’s desire to avoid the

\textsuperscript{78} Fligstein, {	extit{Euroclash: The EU, European Identity, and the Future of Europe}} (OUP, 2008), p. 8.

\textsuperscript{79} Nash, {	extit{The Cultural Politics of Human Rights – Comparing the US and the UK}} (CUP, 2009), pp. 30–34.

\textsuperscript{80} Davis, “Introduction: Normality, power and culture”, in Davis, op. cit. \textit{supra} note 48, pp. 1–19, makes this point, while attempting to highlight similarities with gender and racism studies – though reinforcing gendered stereotypes (of each woman becoming a mother) on p. 1.
perception of suffering. The combination of avoidance and standardization leads to exclusion on different bases: there is stereotyping as well as the reluctance to accommodate different abilities.

Standardizing assumed normality results in partly socially constructed disability. However, social construction is no less decisive for other discrimination grounds. Race may be even more a social construct than disability: there is no scientific justification for dividing humankind into different races. Similar to disability, gender can be seen as a social construct based on physical difference. Within the reference frame of heteronormativity, normalization is also a decisive barrier to gender equality. Limiting opportunity by standardizing assumed normality is thus a common issue across all three nodes.

As the few examples specified initially highlight, the purposes of discrimination law would be ill served if, for example, disability were defined in such a way that impairments frequently suffered by women were not addressed by disability discrimination law. The principle that discrimination grounds cannot be defined in a discriminatory way also applies to the other grounds, and warrants other dimensions within disability. The concept of interrelated nodes illustrates this normative demand as well: if all the nodes overlap, limiting protection within any one category to those not suffering from other discrimination would leave an incomplete picture. Accordingly, the definition of any individual discrimination ground must be such as to maximize protection from discrimination for those suffering disadvantage on other grounds. Thus, the definition of disability must encompass disabilities resulting from the interaction of impairment with other forms of discrimination.

4.3. Summary: Two challenges for defining disability

This section has demonstrated that, in defining disability the Court had to address two formidable and interlinked challenges. First, it needed to move beyond a purely medical approach measuring disability in metric terms, while not sacrificing precision. Secondly, it had to define disability in such a way that impairments related to gender inequality or the exclusion of those classified as ethnic or racial minority are not disproportionally excluded from the field. The next section will consider how the six cases decided by the Court deal with these challenges.
5. **Analysing the Court’s case law against this background**

5.1. *The Court’s case law between models of disability*

Do all these cases constitute a steady progression from a medical towards a social model of disability?

In the 2006 *Chacon Navas* case,\(^{81}\) the Court’s definition of disability in relation to discrimination law started out from the medical model. However, even in this initial ruling, the Court stated that disability in particular – but not necessarily exclusively – results from an impairment limiting the individual capabilities. It thus left scope for acknowledging other causes for the limitation constituting disability. Similarly, Advocate General Geelhoed, though concluding that “disabled people are people with serious limitations due to physical, psychological or mental afflictions”,\(^{82}\) also perceived of a role for the social environment of disabled people insofar as a disability which is not perceived in the social environment will hardly lead to discrimination.\(^{83}\) Nevertheless, neither the Court nor its Advocate General considered any specific contribution of the socio-economic environment to the limitations, and as a consequence excluded long-term illness from the notion of disability. As a consequence, Sonia Chacon Navas could not claim remedies under discrimination law, but was left with the weaker remedies for unfair dismissal.

The next five cases concerning the notion of disability were decided after the EU became a signatory to the CRPD. The Grand Chamber ruling in *HK Danmark (Ring and Skouboe Werge)*\(^{84}\) concerned two secretaries who suffered from illnesses resulting in chronic back pain and, in order to remain able to continue employment, required work-related relief in the form of part time work and a height adjustable desk respectively. Because the employers did not adjust the working environment in line with the employees’ requests, the employees were frequently absent on grounds of pain, and accrued sufficient time of sick leave to justify a dismissal under Danish law in line with their specific contracts of employment. The employees and the trade unions representing them claimed that their frequent illnesses and the subsequent dismissal were caused by their disability, and that the dismissals constituted disability discrimination. The employers insisted that they suffered from long-term illnesses which, as decided in *Chacon Navas*, would not qualify as disability. Accordingly, the Court had the opportunity to revisit the question how to qualify long term illnesses in

---

81. Case C-13/05, *Chacon Navas*.
83. Para 62 of his Opinion.
relation to the notion of disability.\textsuperscript{85} Referring explicitly to the CRPD, the Court first phrased the definition quoted above,\textsuperscript{86} a definition that was praised for recognizing the role of the socio-economic environment in constituting disability.\textsuperscript{87}

The Grand Chamber did not, however, overrule Chacón Navas. Instead, it repeated that illness indeed cannot be equated with disability\textsuperscript{88} and added that also the ability to work only to a limited extent did not constitute disability.\textsuperscript{89} Next the Court reaffirmed that a disability presupposes a “limitation which results in particular from physical, mental or psychological impairments” if that “limitation is long term.”\textsuperscript{90} Between these two phrases, which are repeated verbatim from the Chacon Navas ruling, the Court added that the limitations in interaction between impairment and “various barriers may hinder the full and effective participation of the person concerned in professional life on an equal basis with other workers”.\textsuperscript{91} Thus the Court only modified the Chacon Navas ruling as far as absolutely necessary to pay respect to the CRPD. It certainly did not follow the social model of disability: in its reasoning, societal barriers do not cause the disability. While creating a hindrance to full and effective participation, they potentially add to the limitation which continues to be linked to the impairment suffered by the person so disabled. Nevertheless, the HK Denmark ruling became the main reference point in the Court’s subsequent case law.

The Z case,\textsuperscript{92} as far as the notion of disability is concerned,\textsuperscript{93} evolved around the question whether the claimant was disabled by the refusal of her employer to grant maternity leave after having a child through the use of a surrogate mother. Z had been born without a womb, while displaying all the chromosomes that classic medicine associates with femininity. As she wanted to become a biological mother, she and her husband decided to conclude a commercial agreement on the use of another woman’s womb to carry a child combined from their genes. Z’s employer offered generous arrangements for parental leave, but did not provide maternity leave, since Z had not become a mother. In one limb of her argument, Z relied on disability discrimination law.

\textsuperscript{85} The HK Danmark ruling also contains important statements on the concept of reasonable accommodation, which lie beyond the scope of this article.
\textsuperscript{86} See supra note 38, para 53 of the HK Danmark ruling.
\textsuperscript{87} See the case notes referenced supra note 4.
\textsuperscript{88} Case C-335/11, HK Danmark, para 42.
\textsuperscript{89} Ibid., para 43.
\textsuperscript{90} Ibid., para 47.
\textsuperscript{91} Ibid.
\textsuperscript{92} Case C-363/12, Z.
The Court again duly referred to the CRPD and stated that disability referred to a limitation resulting from long-term physical, mental or psychological impairments which in interaction with various barriers may hinder full participation in professional life.\textsuperscript{94} However, subsequently the Court focused on the impairment alone, stating that the inability to give birth due to the lack of a uterus constitutes a condition which at the same time constitutes a limitation.\textsuperscript{95} Thus, the focus on the medical condition causing a limitation. The Court consequently concluded that “the inability to have a child by conventional means does not in itself … (constitute) a hindrance to the exercise of her professional activity”\textsuperscript{96}.

In this case, the Court clearly struggled with finding a notion of disability which reacts to the impairment and the social conditions which turn the impairment into a disability. On the one hand it focused on the physical status, on the other hand on the limitations of professional activity, seemingly unable to combine the two. Thus, the weakness already visible in the \textit{HK Danmark} ruling can be observed more openly in this ruling, demonstrating that the Court was still relying on medicalized notions of disability. This focus on the physical elements of impairment can be criticized as a move away from a human rights model of disability to a misunderstanding of disability. As a result of all these considerations, the Court held that a person displaying all the markers of femininity except having a womb cannot be considered as disabled in working life, and thus cannot claim maternity leave after entering into a commercial contract concerning the pregnancy of another woman on the basis of reasonable accommodation. We will return to this gendered aspect of the case below.

The \textit{Glatzel} case\textsuperscript{97} seemed to underline the Court’s gradual return to the medical model of disability. The claimant was a lorry driver, who had lost his driving licence due to driving under the influence of alcohol. He had to apply for a new licence, and when he did so the application was refused on a different basis: according to national legislation implementing EU Directive 2006/126, which excluded persons with certain visual impairments from driving heavy goods vehicles, he was considered unable to drive heavy goods transporters safely because of a visual impairment which became apparent during the examination: a substantial functional loss of vision in one eye (but which is compensated by full binocular vision).\textsuperscript{98} The referring court wanted the Court of Justice to rule that Annex III of the Directive was invalid, because

\begin{itemize}
  \item \textsuperscript{94} Case C-363/12, \textit{Z}, para 76.
  \item \textsuperscript{95} Para 79.
  \item \textsuperscript{96} Para 81.
  \item \textsuperscript{97} Case C-356/12, \textit{Wolfgang Glatzel}.
\end{itemize}
it discriminated on grounds of disability. The Court did not comply with that request, finding that limiting the professional life of persons with visual impairments was justified by road safety and public health concerns. While the Court cited its own reasoning in *HK Denmark*, indicating openness to the social model of disability, the Court also analysed the actual visual capacity of the claimant. The Court found that the claimant had full binocular visual acuity, and concluded that it did “not have sufficient information to ascertain whether such an impairment [i.e. weak vision in one eye, which is compensated by the other eye] constitutes a disability”. 99 Accordingly, the Court tried to derive the disability from the impairment as such, omitting any reference to the interaction between society and impairment which creates disability. 100

This narrow view contrasted with the Opinion of Advocate General Bot, who did conceive of Mr Glatzel as disabled by the restrictive legislation following the EU Directive. Like the Court, the Advocate General observed that Mr Glatzel had limited visibility caused by a physical impairment. Advocate General Bot then considered the inflexible definition of full visibility in Directive 2006/126, and concluded that it was this definition which resulted in hindering Mr Glatzel in exercising his profession, thus leaving him disabled. Had the Court followed this argument, it would have acknowledged a moderate social model of disability. 101 However, the Court was not ready to do so. This is surprising because Advocate General Bot came to the same conclusion as the Court in its final recommendation: he opined that Mr Glatzel had been treated differently on grounds of disability, but that withholding professional options from Mr Glatzel was justified as it was necessary to uphold public safety. Accordingly, an adequate notion of disability would not have led to a different result.

Arguably, in the *Kaltoft* case the Court continued on the path of moving away from a moderate version of the social model of disability. Again, the definition of disability developed in *HK Denmark (Ring and Skouboe Werge)* as well as the UN Convention were duly quoted. 102 However, the Court then moved on to state that Mr Kaltoft might be a disabled person “if the obesity … hindered his full and effective participation in professional life … on account of reduced mobility or the onset, in that person, of medical conditions preventing him from carrying out his work or causing

102. Paras. 53 and 64 of the judgment in Case C-354/13, *FAO Kaltoft*; for the definition see *supra* text at note 38.
discomfort when carrying out his professional activity”. Similarly, Advocate General Jääskinnen engaged in physical assessment of obese persons, coming to the conclusion that only obesity class III, requiring a BMI of 40 or higher, can ever lead to disability. Thus, he qualified the degree of deviance from a normal weight as a threshold to accept disability. In the social model of disability, the refusal of an employer to take on a person on grounds of a certain weight might well constitute the barrier which converts the specific weight of that person’s body into a disability. As Advocate General Jääskinnen correctly noted, prejudicial actions such as this could also constitute discrimination. The adequate remedy would not be providing “reasonable accommodation”, but rather demanding that employers refrain from stigmatization.

Analysing all these rulings, we can observe a Court hesitant to embrace the social model of disability or the CRPDs human rights model. Instead it returned to a definition relying on physical elements of a disability concept, which had seemed no longer relevant after the CRPD. Neither did the Court consider finding a definition of disability inspired by the purposes of EU discrimination law, i.e. to prevent discriminatory exclusion on the basis of ascribed otherness. As mentioned, this would suggest defining disability for the purposes of discrimination law without reference to degrees of disability, categories of obesity or levels of pain. All these metric/medical approaches ultimately demand that the disabled person needs to establish their own disability before being able to claim protection.

For the purposes of discrimination law it is completely sufficient that exclusion results from the ascription of disability. Thus, it is unequal treatment based on the assumption that a certain appearance or feature constitutes a barrier to full participation which constitutes disability.

For example, if an employer believes that an obese person needs to lose weight in order to fulfil their tasks, this belief will constitute a disability for obese persons dealing with this employer, irrespective of the truth of that belief. Similarly, if an employer believes that a facially disfigured salesperson will not achieve sufficient profits, this belief will also constitute a disability for persons with facial disfigurements. As long as courts have to deal with mere stereotypes, any definition of thresholds of impairment is wholly dysfunctional. For the Kaltoft case, this would imply that an employer who urges a childminder to lose weight with a weight loss plan is obviously convinced that weight impacts on performance. This would be sufficient to consider the obesity as disability in dealing with this employer. The Court

103. Case C-354/13, FAO Kaltoft, para 60.
104. Para 60 of the Opinion in Case C-354/13, FAO Kaltoft.
105. Ibid., para 39.
could have gone towards a definition of disability adequate for discrimination law and assumed that the employer’s concern with her employee’s weight indicates that being overweight constituted a disability in this environment. Similarly, in the Glatzel case, any metric proof by the claimant would have been unhelpful. The Court should have held that the threshold established in Directive 2006/126 transformed certain visual impairments into disabilities for heavy goods drivers. This would not have answered the question whether this exclusion is justified in the interest of safety and health protection.

Similarly, stereotypes excluding those affected by non-manifest illnesses (such as HIV infection or so-called ‘dry alcoholism’) transform those conditions into disabilities, although they do not constitute impairments.

Defining disability without recourse to metrics or medicalization is more difficult if those affected by impairments really have different abilities than others. In cases such as HK Denmark, where an impairment such as chronic back pain actually reduces the ability to work for more than a few hours a day or other than in a certain bodily position, disability seems to result from the imposition of employment standards that do not respect that difference. Still, any metric approach would not have helped deciding these cases. Instead, a substantive assessment of the employers’ reluctance to accommodate would allow the assessment of whether chronic back pain is a disability under these circumstances. If an employer as soon as the employee is dismissed introduces the variable height desk the employee had required, there is every indication that the dismissal may be discriminatory instead of rational, and would not result from the impairment, but rather the social environment’s (lack of) reaction to it.

5.2. A Court insensitive to intersectional inequalities? Gendered aspects of defining disability

In its first six rulings on the notion of disability, the Court also had to address the second challenge in defining disability – avoiding the intersectionality trap. While disability may also intersect with race and ethnicity, in these cases gendered aspects were more relevant, and thus the intersection of gender and disability will be the focus of these deliberations.

The employment realities as well as the illnesses at stake in HK Denmark (Ring and Skohoe Werge) are typical for women: the majority of secretaries are female, and conditions leading to chronic pain in the back are typically

106. See supra 4.2.
107. On gender segregation in occupation in Europe see European Commission’s Expert Group on Gender and Employment, Gender Segregation in the Labour Market (European Commission, 2009) and Burchell, Hardy, Rubery and Smith, A New Method to Understand
triggered by activities involving spatial confinement, which is frequently
typical for those office posts offered to women.\textsuperscript{108} Also, chronic pain and
associated reduced capacity to perform are typical for impairments disabling
women.\textsuperscript{109} Accordingly, the Court’s reluctant approach towards
acknowledging long-term conditions as impairment giving rise to disability
ensures that conditions more frequently occurring in women are less prone to
bring their bearers within the fold of discrimination law. Such gender
discrimination in defining disability should be avoided.

The gender dimension is even more pronounced in the \textit{Z} case, relating to the
inability to bear children, due to a physical condition, of a person categorized
as a woman. Society continues to expect all women to bear children.
Consequently, infertility is experienced as more stigmatizing by women than
by men.\textsuperscript{110} Infertility has been defined as illness as recently as 2009,\textsuperscript{111} and
this is perceived as an aspect of the medicalization of women’s lives in highly
industrialized societies.\textsuperscript{112} Moreover, while women are generally stigmatized
if they do not bear children for whatever reason, disabled women are
frequently subjected to forced abortion and sterilization, thus depriving them
of the choice to bear children. Thus, the \textit{Z} case necessitated a gendered
perspective on disability in particular. However, this perspective would not
have called for accepting that not being able to bear children is a disadvantage
in employment. On the contrary, men’s inability to bear children is routinely
held up as the reason for women’s weaker employment market position.
Accordingly, in the field of employment the lack of a womb will not be the
starting point for disability. Insofar, the ruling in \textit{Z} would not have had to
change under this perspective.

While Mr Kaltoft is not a woman, that case still involved a field of
occupation where female workers outnumber male workers: care work is still
gendered female.\textsuperscript{113} Also, more women are obese than men.\textsuperscript{114} A number of

act 2008”, in Jones et al. (Eds.), \textit{Gender, Sexualities and the Law} (Routledge, 2011).
\textsuperscript{111} Ireni-Saban, “Give me children or else I die: The politics and policy of cross border
\textsuperscript{112} Greil, McQuillan and Slauson-Blevins, “The social construction of infertility”, 5
\textsuperscript{113} On occupational segregation by gender in Europe see European Commission’s Expert
Group on gender and employment, \textit{Gender Segregation in the Labour Market} (European
Commission, 2009), with a specific case study on professional child care at pp. 81–85; on
studies found that obesity has more negative effects on the employment opportunities and wage levels of women than of men.\textsuperscript{115} More particularly, for women, even mere overweight impacts negatively on employment opportunities.\textsuperscript{116} The negative impact of overweight and obesity is particularly pronounced for black women.\textsuperscript{117} Thus the question whether a child minder can be dismissed because of obesity in the 3rd degree is of more practical relevance to women than to men, and may frequently create situations of inequality at the intersections between gender and disability. In this context it is particularly worthy of note that according to Advocate General Jääskinnen, only morbid obesity should be considered as a disability. Next to not being in line with the social model of disability, this reasoning is also likely to deprive more women than men of the protection of disability discrimination law.

So far, none of the cases that found their way to the Court of Justice has established ethnic or racial dimensions of disability. However, such dimensions undoubtedly exist. The more negative impact of obesity on employment opportunities of women of colour has already been mentioned as an example. While not debated before the Court of Justice yet, the stigmatization of Roma children as mentally disabled in order to achieve ethnically segregated schools has been brought before the European Court of Human Rights.\textsuperscript{118}

6. Conclusion

Developing the notion of disability for the purposes of EU discrimination law, the Court has certainly made progress from its first ruling in 2006 to its sixth

\textsuperscript{114} The main measurement for obesity is the Body Mass Index, calculated as a function of height and weight, which classes a woman as obese if her BMI is above 30. According to WHO statistics, in 2008 10% of men and 14% of women were obese. In Europe, the sex difference was less pronounced: 22% of women and 20% of men were obese. <www.who.int/gho/ncd/risk_factors/obesity_text/en>.

one in 2014. However, as so frequently in EU law, progress has been halting and fitful. There is still some ground to cover for the Court to arrive at an acceptable and workable definition of disability for the purposes of discrimination law.

This article has argued that a steady move from a medical to a social model of disability is not the solution for defining disability for the purposes of discrimination law. Instead it has argued that a definition of all discrimination grounds, including disability, can be derived from the purposes of discrimination law: protecting against the harm of exclusion on the grounds of ascribed otherness, and protecting individuation as well as respecting difference. The fact that there is a common rationale of discrimination law for the three interconnected nodes sex/gender, race/ethnicity and disability also suggests that discrimination grounds should be defined in such a way that they are not mutually exclusive, but rather reinforce each other.

It has been shown that for disability discrimination, this approach mitigates against a metric approach to disability, which would derive the definition of disability from a certain level of impairment.

Beyond that, a workable purposive definition of disability will be easy to find where false stereotyping results in excluding persons perceived as disabled from participation in employment or other activities. Such exclusion may be based on an employer’s reference, as in the *HK Danmark* case, or on legislation, as in the *Glatzel* case. In cases where impairment restricts the radius of activities with acute relevance to the desired form of participation, disability is established when access to or progression in employment for those persons is hindered through a lack of flexibility to adapt. The impairment clearly constitutes a starting point for acknowledging disability in these cases.

It has further been demonstrated that neither the social model of disability nor the Court’s case law avoids the intersectionality trap. Instead, the definition of disability tends to move impairments suffered disproportionally by women beyond the reach of disability discrimination law. Especially in cases of chronic illnesses involving pain, recognizing the impairment through suffering while defining disability is important from the perspective of intersecting nodes of discrimination grounds: defining disability in such a way that impairments typically suffered by women are not typically recognized as protected under disability discrimination law constitutes gender discrimination. This has also shown that intersectionality theory plays an important role in defining individual discrimination grounds.

All this results in a clearly defined, but nevertheless wide notion of disability. In all six cases discussed above, the Court should have stated that the claimants had been disabled, with the exception of the *Z* case. The wide
notion of disability is balanced by the exceptions allowing unequal treatment on grounds of disability, including the *bona fide* occupational requirement (Art. 2 Directive 2000/78), as well as limitations on the obligation to provide reasonable accommodation.

These limitations also show the limits of disability discrimination law, which clearly is unable to bring about the desired participation of disabled persons in all areas of life. In line with the human rights approach to disability promoted by the CRPD a range of rights and policies are required to ensure that disabled people are included and able to fully participate in society on equal terms.119 Its limited reach is due to the specific mission of discrimination law as a whole, which is best achieved if the focus of discrimination law is not lost.

119. Degener, op. cit. *supra* note 12, No. 5.
